Ratna Rajya Laxmi Campus

Supervisor's Recommendation

I hereby recommend that this project prepared under my supervision by Jayanti Ghising and Indira Guragain entitled “Online Hotel Reservation System” in partial fulfillment of the requirements for the degree of Bachelor of Computer Application is recommended for the final evaluation.

Bhupendra Ram Luhar

Supervisor

Tribhuvan University
Faculty of Humanities and Social Sciences
Ratna Rajya Laxmi Campus

LETTER OF APPROVAL

----- Bhupendra Ram Luhar Department of BCA Ratna Rajya Laxmi Campus Exhibition Road, Kathmandu	----- Dr.Buddhi Prashad Sapkota Department of BCA Ratna Rajya Laxmi Campus Exhibition Road, Kathmandu
----- Internal Examiner	----- External Examiner

ACKNOWLEDGEMENT

In efficiently finishing this project, many people have helped us. We would love to thank all individuals who are associated with this project.

We would love to thank our project manager **Mr. Bhupendra Ram Luhar**, and our coordinator **Dr. Buddhi Prashad Sapkota** under whose guidance we found out plenty about this project and have been able to finish this project.

Also, we would love to thank my friends who've helped us with their treasured recommendations and guidance and were very beneficial in numerous levels of project completion.

ABSTRACT

The Online Hotel Reservation System is a project applied for GG Hotel, that's an imaginary hotel. It gives people all over the world an easy and rapid manner to book hotel rooms online. The interface of the Online Hotel Reservation System is Web pages that can be accessed with a Web browser. The system is applied in PHP (Hypertext Preprocessor) and HTML (Hyper Text Markup Language). Users can perform room reserving activities at GG Hotel each time and everywhere via way of means of gaining access to it through the Internet. The Online Hotel Reservation System is an easy-to-use application. Everyone who is aware of a way to use a Web browser can effortlessly perform reserving, change the reserving details, cancel the reserving, change the non-public profile, view the reserving history, or view the hotel records via way of means of following its easy and clean GUI (Graphical user interface) design.

Keywords: Online systems, hotel reservation system, website

Chapter 1: INTRODUCTION

1.1. Introduction of OHRS

The title of this project is 'Online Hotel Reservation System'. As the title suggests it is a web-based application that lets users easily book desired hotels rooms and perform other booking activities from home via the Internet.

Usually, hotels use multiple online distribution channels in order to be more visible on the Internet and to attract as many clients as possible. Many hotels developed their own websites in order to promote their products and services, to attract clients and also to offer them the opportunity to book a hotel room directly on the website, without using other intermediaries. In this way hotels don't have to pay commissions to online travel agencies or to other third parties, they can sell their services directly to clients.

Online Hotel Reservation system is becoming more and more popular these days because of an ongoing covid-19 pandemic; people don't want to come in contact with other people. The computerized hotel reservation system deals with reservation booking, canceling reservations and check-in and check-out of the customers. The manual hotel booking method comes with various problems. Some of them are a customer having little information about the rooms they are booking and they might be the victim of the hotel's staff fraud charging them twice the original price in case of an emergency. There is no guarantee of getting valid information from the customers which can result in the loss of the hotel's reputation and revenue. Also, the process of filling in personal information by the customer and retrieving information by the manager is time-consuming.

The main purpose of this project is to develop a web-based application that resolves these difficulties making the whole hotel booking process easier for both customer and the hotel owner. Since the customer can browse the relevant information of any hotels in the palm of their hands, they can book rooms according to their budget and their taste. The project uses a regular web browser with HTML (HyperText Markup Language) as the basic interface language and also php and MySQL. Users can perform booking activities via any internet browser. The administration can also view all users' data and maintain the website.

1.2 Problem of statement

Manual hotel booking always creates problems as every work has to be done by humans. Usually, problems arise when the customer has little to no information about the rooms, they are booking resulting in the room being either too expensive or not what they exactly wanted. The process of checking in and out is delayed by the receptionist. So, by making the hotel reservation system online we can reduce these problems by half or more. Customers can themselves book rooms by checking the availability of that particular room in that hotel or by checking the price range. The record-keeping process becomes faster and effective for both customers and hotel owners.

1.3. Objective

- I. To provide people seeking hotel rooms with accurate information about available accommodations.
- II. To provide up to date information about the status of reservations.

1.4. Scope and Limitations

1.4.1 Scope

1. Users can register and they can view and change their details.
2. Users can book a room on any specific date.
3. Anyone can view the website and can book if they have an account.
4. Admin can modify the details of the website including the room information, contact us information, etc.

1.4.2 Limitation

1. As with all other online platform, there may be loss of data in the database due to some error.
2. Users can only change some of their details like username, email, address and mobile number among others details.
3. Since time is limited, the quality of this project might be compromised.

1.5. Report Organization

Chapter 1 includes introduction of the system OHRS with its problem of statement, objective and its scope and limitation.

Chapter 2 includes the background study of online hotel reservation and some literature review of other online hotel reservation systems.

Chapter 3 includes the functional and non-functional requirements along with feasibility Analysis and architectural design of the OHRS.

Chapter 4 includes about the tools used in this system and the testing that are done.

Chapter 5 includes about the outcome of this system as well as the future recommendations for the OHRS.

Chapter 2: Background Study and Literature Review

2.1. Background Study

The Computer Booking System (CBS) has delivered several alternate development and performance in hotel operations. A hotel can simply be defined as a building or an area to acquire amazing rooms and live for a brief duration of time, additionally an area of refreshment, enjoyment, and safety for the visitors. In many states or international locations, a hotel and motel are described primarily based totally on their status. Hotels and different lodging are as numerous as many own circles of relatives and commercial enterprise tourists they accommodate. Most lodges and motels are classified ads homes that cater in particular to commercial enterprise people, travelers, and different tourists who want to lodge for a quick life. A small, however developing luxurious hotel chains additionally manipulate rental till in mixture with their temporary rooms, offering each lodges visitor and rental proprietor with getting right of entry to the equal carrier amenities.

There are a few laid down ideas regulating every room that may be occupied with the aid of using every quest. Hotels reserving and control machines in Winika Gboko begin with the difficulty of price tag to involved clients. Customers have received a price tag on the price of stipulated charges entire and go back the price tag to the hotel. The Winika Hotel now kinds the price tag consistent with the varieties of rooms you need and ships to the numerous devices withinside the inn for processing. The clients are picked primarily based totally on the carrier needed.[1]

2.2. Literature Review

Shangri-La Sentosa Resort in Singapore is one of the hotel chains for Shangri-La Corporation. Its official website consists of many useful functions and is purposed at providing the hotel's information as well as an online reservation system. Visitors can get the hotel information such as hotel location, room rates, promotions, room description, photo gallery and other hotel facilities from their website (www.shangri-la.com/singapore/shangrila). It has a virtual tour of the hotel. The places available in virtual tour is lobby, rooms, function rooms, recreation, restaurant and bars. The hotel's menu bar is on the left-hand side of the page. Each visitor has to install a Java app before he/she can view the virtual tour application anyway. For businessperson usage, the website provides a function, which is called meeting planner to assist

them to plan their meetings. To reserve a room, there is a form for guests to fill in their reservation details. In addition to room reservation, guests may fill in another form to make special requests for their reservation. The structure of this website is well organized and easy to navigate through. Visitors may get a lot of information from this website. The content of the website is normally up-to-date. These are important to apply in developing such a system, as information is crucial for potential guests. The system must make sure that potential guests get the correct information, such as room rate and hotel location.[2]

Hotel Swiss Garden is a well edified hotel located in Kuala Lumpur. Its website consists of several functions and aims at providing customers accurate information about the hotel as well as their online reservation system (www.swissgarden.net). Visitors can get hotel information such as location of hotel, room rates, room description and hotel facilities. The reservation process requires guests to fill their details on a reservation form. Reservation is guaranteed by giving credit card details or by cash deposit. The layout of their online system is clear and user-friendly. Guests can browse through to get information easily. This online system shows a picture of the hotel room. Guests are not able to view the whole picture of the room they are going to reserve but a picture is worth thousand words. Instead of using words to explain the room condition, it is more suitable for guests to have a virtual tour of the room they are going to stay in. This can increase customer satisfaction. The online system of Swiss-Garden is fully organized by its developer. The disadvantage of their online system is that there is no telephone/mobile phone number to enable customers reach them; they have only provided the physical address. [3]

Recent changes in information technologies have transformed business models and shifted consumption patterns, facilitating the rapid rise of the sharing economy, fostering non-traditional direct trading relationships between providers and end-users through online platforms. Exploring the institutionalization of the sharing economy, in particular Airbnb, this study analyses representations of the sharing economy in the academic literature alongside news articles about Airbnb. To explore the concerns expressed by journalists and academics in their coverage of the sharing economy, representative texts from both fields were analyzed, revealing implications for scholars, journalists and providers in the traditional and sharing accommodation sectors.[4]

Booking.com specializes in hotels and other travel accommodations, so it shouldn't come as a surprise they top the list of the best hotel booking sites. They offer deals on vacation rentals, hostels, and bed and breakfasts, as well as many other hard-to-find property types. Booking.com customers have reported a high degree of satisfaction with their service, particularly the ease of the booking process. Get started by entering your destination and travel dates. Then, using their filtering tools, you can focus your results on certain amenities and other details that are important to you. There's also the option to run a theme search, which isn't something you'll find with most hotel sites. These searches are ideal when you're trying to quickly locate a family-friendly or business hotel, for example. Once you've found the right place, click into it to view more detailed information and book it right away. If you're not near a computer, you can also book your hotel from Booking.com's mobile app and check today's rates at the hotels in your area if you need to make a last-minute reservation. [5]

Chapter 3: System Analysis and Design

3.1. System analysis

3.1.1. Requirement Analysis

I. Functional requirement

A functional requirement (FR) is an outline of the service that the OHRS must offer. Features the system must provide are refined into use case diagrams. to best capture the functional requirements of the system.

Use Case Diagram:

The fig 3.1 is the use case diagram of OHRS. There are two actors, user and admin. User shall register themselves into the system, after registration they shall login and logout, make reservation of any desired rooms, shall change their personal details, shall check whether a room is available or not and also shall cancel their reservation. Similarly, the admin shall login and logout of the system, they shall manage user or room i.e., they shall add, remove any user or rooms they want and also shall cancel any user's reservation.

fig 3.1: Use Case Diagram Of OHRS

II. Non-Functional requirement:

- i. **Availability:** This project is a web-based application. Meaning any browsers (Microsoft edge, chrome etc.) can be used. Also, the system shall be operational 24hrs a day and 7 days a week.
- ii. **Security:** This system has divided the role of admin and its user. Here only the admin can access the database which makes the system secure from vulnerability. Access to the system is protected by user log in form with email and password.
- iii. **Performance:** This system is designed for clean overall performance result. The performance of the OHRS will highly depend on the performance of the hardware and software components of the installed devices. Responses to view information shall take no longer than 5 seconds to appear on the screen.
- iv. **Usability:** This system is very easy to use as it is written using basic html and php so that the user can interact with the system easily to do the needed work. And its security feature makes it very secure and reliable.

3.1.2. Feasibility study

A feasibility study is an assessment of the practicality of a proposed plan or project. Following feasibilities were studied before building the system.

i. Economic feasibility:

In the existing system, the hotel needed to hold many registers/books that are a costly affair. This may be decreased with the aid of maintaining data in a virtual layout that is dependable and cheaper. This system is quite simple and it does not require extra software and hardware i.e., it makes use of open-source code.

ii. Operational feasibility:

The fundamental motive of this program is to increase a web-based application that helps online reservations of hotel lodging via the internet. This system makes use of easy technology, therefore, making it user- and all inputs are to be taken self-explanatory even through a layman. This system reduces plenty of human attempts and mistakes as well. Therefore, this project is operationally feasible.

iii. Technical feasibility:

This includes the study of function, overall performance, and constraints that would have an impact on the potential to gain the ideal system, as required. Here,

one has to check whether or not the system may be developed by the use of current technology or not. This system has used HTML, and CSS as front-end and PHP, and SQL server as backend. This system is a more realistic and mature approach to online hotel room reservations.

3.1.3. Data Modeling (ER-Diagram)

fig 3.2: ER-Diagram Of OHRS

The fig 3.2 is the ER-diagram of Online Hotel Reservation System. There are 4 entities in this diagram (User, Admin, Room, Booking). Many users shall book many rooms at a time thus user has one to many relationships with Rooms entity. Many rooms shall be managed by one admin thus rooms and admin have many to one relationship as. Many bookings shall also be cancelled by one admin so admin and booking has many to one relationship. Many bookings are done for many rooms so room and booking have many to many relationships.

3.1.4. Process Model (DFD)

Level-0(Context level Diagram):

fig 3.3: Context Level DFD Of OHRS

The fig 3.3 is also known as context level diagram. It's a basic overview of the whole system or process being designed. The above context level diagram shows the basic overview of "Online Hotel Reservation System". Here user shall register themselves in the website by filling their basic information which is then stored in database. They shall also check the room availability and then book the desired room. Users shall cancel their reservation and also, they shall logout of the system as pleased. Similarly, the admin shall view and manage all the user's details, and cancel any user's reservation and shall logout of the system as well.

Level-1(Data flow Diagram):

The fig 3.4 provides a more detailed breakout of pieces of contex level diagram. The above DFD provides the detail information of the context level diagram of "Online hotel reservation system". Th diagram shows that the user shall log into the sytem to register them into the system. They shall also change their few details like name, address, email or mobile number if wanted. They shall check whether there is room available and shall make reservation as per their need.The user shall also cancel their reservation if wanted.

Similarly the admin shall view, add and manage the user's details, room details. They shall also cancel any users reservation and logout of the system.

fig 3.4: Level-1 DFD Of OHRS

3.2. System Design

3.2.1. Architectural Design

The fig 3.5 represents the architectural design of the system OHRS. There are two modules in this system user and admin. User shall register themselves into the system by filling up the necessary details and those details are saved in the user table of the database. After registration they shall login to the system and they shall book desired rooms also by filling necessary details and those details now will be saved in the booking table in the database. Similarly, admin shall login to the system, manage user, room and booking details as they have access to the database.

fig 3.5: CMS Data Module Of OHRS

3.2.2. Database Schema Design

Fig 3.6 represent the database schema of the system OHRS. Database schema design is an approach for building a framework for data management. It is a summary layout that constitutes the storage of our data in a database. It describes each organization of data and the relationships among tables in an offered database. It is like a blueprint for a large quantity of data.

fig 3.6: Database Schema Of OHRS

3.2.3. Interface Design (UI Interface / Interface Structure Diagrams)

User Interface design is concerned with the dialogue between a user and the system. It is concerned with the entirety from beginning the system or logging into the system to the finally provided of preferred inputs and outputs.

Front page:

The fig 3.7 is the user interface of the system OHRS. It is the first page that opens in the screen when the user visits the website via any browser. From there users shall log in if they have an account by pressing the login button. They shall also explore all the rooms that are available and book the desired room.

Fig 3.7: UI Design Of Front Page Of OHRS

Login page:

The fig 3.8 is the user interface of login page of the system OHRS. By clicking on the login button, users shall log into the system by providing their correct email address and their password if they have an account. If they provide an incorrect email or password the system won't let them log into the system.

Signup page:

The fig 3.9 is the user interface of signup page of OHRS. By clicking on the signup link user gets transferred to the signup page where they have to fill up all the necessary details required like username, password, email, phone number, address, age, gender and module which is prewritten as user and then click on the signup button to be registered into the system. All these information gets stored into the database of the system. After that, they shall log in to the system by providing the correct email and password.

3.2.4. Physical DFD

Fig 3.10: Physical DFD of OHRS

Fig 3.10 represents the physical data flow diagram of the system Online Hotel Reservation System. Physical data flow diagrams focus on how things happen in an information flow. These diagrams specify the software, hardware, files, and people involved in an information flow. A detailed physical data flow diagram can facilitate the development of the code needed to implement a data system.

Chapter 4: Implementation and Testing

4.1. Implementation

Implementation is the stage where physical system specifications are transformed right into an operating and dependable solution. It specifies how the system is installed, operated, and maintained. It additionally guarantees that the system meets high-satisfactory standards. System implementation is the test of a program that exercises the whole system in its real surroundings to decide its abilities and barriers which additionally demonstrates that the system is functionally operative, and is compatible with the opposite subsystems and helping factors required for its operational deployment.

Several types of equipment are used on this section of the software program development. The equipment and strategies used to implement the system and the implementation info of diverse modules of OHRS are as follows:

4.1.1. Tools Used (CASE tools, Programming languages, Database platforms)

1. Draw.io:

Draw.io is an online diagram editor constructed around google drive. Using draw.io we have been capable of creating UML diagrams, entity relations diagrams, and plenty more. One of the benefits of draw.io is that it stores the information in google drive, consequently, there's no need for an extra third party.

2.MySql:

MySQL is presently the most famous database management system software used for dealing with relational databases.

It was used along with PHP scripts for developing our database structure. It became extensively utilized to carry out numerous activities like insertion, deletion, and update of the records saved in the database.

3. Visual Studio Code:

Visual Studio Code is a lightweight but powerful source code editor which runs on computer systems and is available for Windows, macOS, and Linux. It comes with integrated assistance for JavaScript, TypeScript, and Node due to which we had been capable of writing our code quicker and easier.

4. HTML:

HTML is a markup language used by the browser to manipulate text, images, and different content with the purpose to show it in the required format. For the implementation in the front end, we've used HTML for a terrific appearance and sense to the user with the display of the contents of the layout and the system. Different markup tags are used like anchor tags for hyperlinks and form tags for forms.

5.CSS:

CSS stands for Cascading Style Sheets. CSS describes how HTML elements are to be displayed on the screen, on paper, or in different media. we've used CSS used to define styles on our web pages, which include the design, layout, and versions in the show for different devices and screen sizes.

6. PHP:

PHP is a server-side scripting language that is embedded in HTML. It is included with some of the famous databases, which include MySQL, and its usage has helped us add, delete, and modify elements inside our database via PHP. Using PHP, we had been capable of limiting customers to get entry to a few pages of our website.

4.1.2. Implementation Details of Modules (Description of Procedures/functions)

Our project consists of total 4 modules and they are:

1. Signup Module:

This module is used to register the new user or customer into the system. Here user has to fill up all the necessary details about themselves to get registered. These data gathered are first validated and then stored into the database using SQL query. After the registration the registered user shall log into the system by providing email and password which is identical to the email and password stored into the database.

2. User Management Module:

This module is used for the manipulation of user details which includes addition, deletion and updating details. In the system OHRS admin is the one who manage the user. After the user register themselves into the system their data are saved into the database and admin has the full access to the database of the system because of which admin can add, delete or manipulate any user's details.

3. Room Management Module:

This module is used for the manipulation of room details which includes addition, deletion and updating of the room details. Admin has the full access to the database so only they can add any rooms into the system. Also, they can remove and manipulate any rooms details as pleased or as instructed.

4. Booking Management Details:

This module is used for the manipulation of booking details which include booking and cancellation of the booked rooms. Admin has the full access to the database so only, they can remove any booking of any user as pleased or as instructed.

4.2. Testing

The testing section is accomplished to affirm and validate the OHRS. The OHRS is examined to test if the final system can work in keeping with what we have been waiting for and is free from any programming and logical errors. It additionally makes sure whether or not all of the systems and requirements are met or not.

4.2.1. Test Cases for Unit Testing

Unit testing is a software program development method in which the smallest testable components of an application, known as units, are individually and independently scrutinized for correct operation. Below are the numerous tables for distinctive test cases:

Table 4.1: Test case for Login

Pre-conditions: User is already registered in the system.				
S.N.	Input	Expected Outcome	Output	Remarks
1	Navigate to login page	Login page should open	As expected, user was able to navigate to login page	User was able to navigate the login page of OHRS
2	Correct email and password	User must login successfully	User logged into the system	User was able to access the services provided by the system

3	Incorrect email but correct password	User must not login	User was not logged into the system	User was not able to access the services provided by the system
4	Correct email but incorrect password	User must not login	User was not logged into the system	User was not able to access the services provided by the system
Post-condition: User is validated with database and successfully login to OHRS system.				

Table 4.2: Test Case for Room Reservation

Pre-conditions: User should login to HRS. User has to provide all the necessary details and reserve a room				
S.N.	Test Cases	Input	Expected Outcome	Output
1	Navigate to reservation page		Reservation page should open	As Expected, user was able to navigate page
2	Reservation of a Room	Full Name: Sita Kumari Phone: 9847483600 Room No:126 Check-In: 8/7/2022 Check-Out: 6/11/2022 Adults:1 Children:0	Desired room should be booked	As expected, user was able to book their desired room with all necessary details

3	Cancellation of reserved room	Click on the cancel button	The reserved room must be cancelled.	As expected, the room reserved by the user must be cancelled.
Post-conditions: User provide their information and reserve room. The reservation session details are logged in to the database.				

4.2.2. Test Cases for System Testing

System Testing is a form of software testing that is executed on a complete integrated system to assess the compliance of the system with the corresponding requirements.

Table 4.3: Test case for System

S.N.	Test Case	Input	Expected Outcome	Output
1	Check with login	Email: ghisingjayanti@gmail.com Password: tpwk	Successful login	Opens dashboard of OHRS
2	Check with User Register	If required fields are filled with defined data type	Successful entry of new user	Inserted data into database in user table
3	Check with delete, edit user	Search User id. Click edit or delete button	Must be edited or deleted	Edit or delete user record in database
4	Check with Room Entry	If required fields are filled with defined data type	Successful Entry	Inserted data into database in room table
5	Check with delete, edit room	Search room id. Click edit or delete button	Must be edited or deleted	Edit or delete room record in database

6	Check with booking	If required fields are filled with defined data type	Successful booking	Inserted data into database in booking table
7	Check with cancel booking	Search booking id. Click delete or cancel button	Must be cancelled	Delete booking details from database
8	Check with logout	Click logout button	Successfully logout	Redirect to login

Chapter 5: Conclusion and Future Recommendations

5.1. Lesson learnt/ Outcome

After finishing our project entitled Online Hotel Reservation System, we could gladly say that we've received a tremendous amount of understanding about how the project is accomplished in actual life. We had been not able to do this project at the start because of a lack of information in some the area however with remarkable support, we could ultimately complete our project. Even though the project we have developed isn't ideal in each thing however the experience we've got as a team from competing this project is appreciable.

5.2. Conclusion

Based on the facts and on the data gathered, the conclusion is that the GG Hotel is in need of a reservation system improvement and has come up with the ideal solution. The proponents have preferred a system with the purpose to streamline the system of processing reservations with a web reservation system with the subsequent modules:

Each users could have a completely unique email and password as a result making the system extra secure not only for the hotel but also for the user of the system. With the implementation of MySQL, as the system back end, data which are saved in MySQL are very reachable and may be effortlessly manipulated with the primary expertise of SQL. This makes the system more reliable as the user can seek accurate information about the hotel rooms and available accommodations. Also, the system had a way to provide up to date information about the status of reservation.

5.3. Future Recommendations

The possible improvements that can be made for the Online Hotel Reservation System include:

- i. Making the graphical user interface friendlier and more functional in the next development.
- ii. Sending notifications to the customers about the booking conformation and also about booking cancellation.
- iii. Adding Online payment System.
- iv. Allowing user to book multiple room at a time.
- v. Giving privilege to the super admin to add sun admin.

1. Home Page:

2. About us Page:

3. Contact Us Page:

4. Login Form:

The screenshot shows a web browser window with a single tab titled "Login". The address bar displays the URL "localhost/projecthotelbooking/projecthotelbooking/login.php". The login form is a blue rectangular box with the following elements:

- Title: "Login to the website"
- Label: "Emaili" (likely a typo for Email)
- Input field: A white text box for email.
- Label: "Password"
- Input field: A white text box for password.
- Button: A pink button labeled "Login".
- Link: A purple link that says "Don't have an account? Signup".

5. Sign Up Form:

The screenshot shows a web browser window with a single tab titled "Signup". The address bar displays the URL "localhost/projecthotelbooking/projecthotelbooking/signup.php". The sign up form is a blue rectangular box with the following elements:

- Title: "Create an account"
- Label: "User Name"
- Input field: A white text box with placeholder text "Enter your Full Name".
- Label: "Password"
- Input field: A white text box with placeholder text "Enter your Password".
- Label: "Conform password" (likely a typo for Confirm password)
- Input field: A white text box with placeholder text "Re-enter your Password".
- Label: "Address"
- Input field: A white text box with placeholder text "Enter your Address".
- Label: "Age"
- Input field: A white text box with placeholder text "Enter your Age".
- Label: "Mobile Number"
- Input field: A white text box with placeholder text "Enter your Mobile number".
- Label: "Email"
- Input field: A white text box with placeholder text "Enter your Email Address".
- Label: "Gender" followed by a dropdown menu showing "Select".
- Label: "Module"
- Input field: A white text box containing the text "user".
- Text: "By creating an account you agree to our [Terms & Privacy](#)."
- Button: A pink button labeled "Signup".
- Link: A purple link that says "Already have an account/login".

6. Admin Dashboard:

The screenshot shows a web browser window with the URL `localhost/projecthotelbooking/projecthotelbooking/admindashboard1.php`. The page features a red sidebar on the left with a key icon and the following menu items: Dashboard, Users, Manage Rooms, Booking, and Logout. The main content area is titled "Booking" and includes a "View All" button. Below the title is a table with 8 rows of booking data.

SN	Room No	Name	Phone	Check_in	Check_out	Adults	Children	Actions
1	108	Hari Bahadur	9844900852	2022-05-18	2022-05-18	3	1	Cancel
2	105	Laxman	9844885599	2022-05-18	2022-05-19	5	3	Cancel
3	101	Krishna	9844556655	2022-05-19	2022-05-18	5	2	Cancel
